SHORTENED STATUTORY PERIOD OF RESPONSE	NOTIFICATION DATE	DELIVERY MODE
3 MONTHS	03/02/2007	ELECTRONIC

Please find below and/or attached an Office communication concerning this application or proceeding.

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

Notice of this Office communication was sent electronically on the above-indicated "Notification Date" and has a shortened statutory period for reply of 3 MONTHS from 03/02/2007.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

patentdocket@oblon.com
oblonpat@oblon.com
jgardner@oblon.com

DETAILED ACTION

1. Claims **1-20** have been considered.

Information Disclosure Statements

2. Information Disclosure Statement submitted by the applicant on 12/5/2006 has been considered. Document number 2001-195430 (reference numbered AO in the attached form PTO-1449) is an unedited computer generated English translation, which is not clear to read and understand. An improved translation is required for consideration and evaluation as related prior art. The referenced numbered AW is in Japanese with no English translation.

Response to Arguments

3. Applicant's arguments have been fully considered but are not persuasive.

With respect to claims 1 and 7, applicant argues, "Shurts does not teach or suggest a metadata storage unit which stores metadata relating to a user of the communication device." However, as indicated in the previous office action, Shurts suggests a metadata storage unit. Per column 6 lines 1 to 15, the metadata includes the owner of

Art Unit: 2132

the data. Therefore, Shurts' stored metadata relates to the user of data, who uses the communication device to send his data.

Applicant further argues, "Shurts does not teach or suggest storing metadata received through a radio communication unit in a corresponding partition of a metadata storage unit based on matching the received metadata with a security level and/or category predetermined by the user." However, as indicated in the previous office action, Shurts explains the enforcement of MAC rules using labels in col. 1, line 52 to col. 2 line 5. Shurts specifically defines security levels and categories in col. 4, line 55 to col. 5, line 51, and particularly in col. 5 lines 7-20. MAC rules are typically implemented in Operating Systems and allow secure storage and access of data based on the labels assigned to data. Therefore, in Shurts system, each data object receives a label (level and/or category), which is used to determine if access to data object is allowed or not. Therefore, each data object is stored based on the assigned security label, and in a portion of metadata storage that corresponds to the assigned label.

Applicant further argues, "Shurts does not describe storing metadata relating to a user of an information communication device on the information communication device itself. However, as described above, Shurts teaches storing the owner of the data as part of the stored data, and therefore stores information relating to the user. Note that storing the data on the communication device itself is not part of the claims at hand.

Art Unit: 2132

With respect to claims 2 and 8, applicant argues: "Shurts actually teaches away from the features recited in Claims 2 and 8. In Shurts, the metadata is used to identify objects in a database not as the objects of the database itself." However, it is not clear what is meant by "the metadata is used to identify objects in a database not as the objects of the database itself". Metadata is data itself and is stored as data. More importantly, it is not clear how the fact that "the metadata is used to identify objects in a database not as the objects of the database itself" shows that Shurts teaches away from the features of claims 2 and 8.

Applicant further argues: "Shurts makes no mention of "locations visited by the user."" However, locations visited by a user are data related to a user. A system capable of storing data related to a user is well capable of storing the information of locations visited by the user. In other words, barring any unexpected result, a person skilled in art would have store the data indicating location visited by a user if an application requires such data.

With regards to claim 13, applicant argues: "Shurts clearly does not describe or suggest a metadata transmitting means which provides user terminals with metadata that corresponds to a security level and at least one category at different locations in the physical world." However, as mentioned in the previous office action, Timmer and Shurts teach two-way communication systems that exchange data. Timmer specifically

Art Unit: 2132

teaches exchanging emails, which make data available in different locations in the physical world.

Further, applicant argues: "Shurts also clearly does not describe acquiring metadata from user terminals, matching the metadata and presenting the match to the user terminals from which the metadata was acquired." However, providing data based on matching the security label of data against the privileges of the requesting use is the essence of security systems based on labels (MAC), which is clearly suggested by Shurts.

Based on the above discussion, applicant's arguments are not persuasive.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 1, 3, 4, 6, 7, 9-10, 12, 13, 15, 16, 18-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Shurts (U.S. Patent No. 5,572,673, dated Nov. 5, 1996).

5.1. As per claim 1, Shurts is directed to an information communication device which supports information exchange and fostering of human relations between a plurality of users, (item 54 in Fig. 5 and associated text), comprising: a radio communication unit which transmits and receives radio communication data (col. 14, lines 16-30 describes item 54 in Fig. 5, capable of communication using radio); a metadata storage unit which stores metadata relating to a user of the communication device (col. 8 line 60 to col. 9 line 15 describes the security system of Shurts, which includes a system catalog. The system catalog, as defined in col. 6 lines 1-15 includes metadata. One of the items stored as metadata is the owner of data, which is a user of the communication device); and a central control unit which manages the storage of metadata in said metadata storage unit (the CPU, item 62 in Fig. 5 controls and manages the storage of all data in the system which includes metadata), wherein said central control unit partitions said metadata storage unit by security level and category, stores metadata received through said radio communication unit in a corresponding partition of the metadata storage unit based on matching the received metadata with a security level and/or category predetermined by the user (use of levels and categories to enforce access security is well-known in the art. Shurts explains the enforcement of MAC rules using labels in col. 1, line 52 to col. 2 line 5. Shurts specifically defines security levels and categories in col. 4, line 55 to col. 5, line 51, and particularly in col. 5 lines 7-20. MAC rules are typically implemented in Operating Systems and allow secure storage and access of data based on the labels assigned to data. Therefore, in Shurts system, each data object receives a

Art Unit: 2132

label (level and/or category), which is used to determine if access to data object is allowed or not. Therefore, each data object is stored based on the assigned security label, and in a portion of metadata storage that corresponds to the assigned label.), supplies, in response to an external access request, metadata from the metadata storage unit that matches a security level available to the external access request or that matches the security level available and category requested (As mentioned above, Shurts suggests deployment of MAC rules to enforce security, which supplies data to a requestor only if the level and/or category of the requestor matches that of the requested data).

5.2. As per claim 3, Shurts is directed to the information communication device according to claim 1, further comprising: a user input unit for the user of the device to write metadata directly into said metadata storage unit (col. 14 lines 5-15 describes a key which allows user enter user data).

5.3. As per claim 4, Shurts is directed to the information communication device according to claim 1, wherein said central control unit sets a higher security level for data transmitted through a relatively secure communication path and a lower security level for other transmitted data (as explained in col. 1 line 53 to col. 2 line 5, the more sensitive data gets a higher level or category. The more sensitive data is typically transmitted in the more secured transmission system).

Art Unit: 2132

5.4. As per claim 6, Shurts is directed to the information communication device according to claim 1, further comprising: a format setting unit which converts the format of metadata taken out of said metadata storage unit as requested by a requesting party (according to col. 5 lines 40 to 55, the database maybe queried using different languages, and therefore it is formed in the format requested by a requesting party).

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 2, 8, 14 and 17 are rejected under 35 U.S.C. 103(a) as being obvious over Shurts as applied to claims 1 above.

7.1. As per claim 2, Shurts is directed to the information communication device according to claim 1, wherein said metadata is information in the form of metadata, equivalent to a log providing information on locations visited by the user (Shurts is directed to a secured database system and the purpose of databases is storing linked pieces of information such as the user, its visits and the visited place. A system capable of storing data related to a user is well capable of storing the information of locations

Art Unit: 2132

visited by the user. In other words, barring any unexpected result, a person skilled in art would have store the data indicating location visited by a user if an application requires such data).

7.2. Claims 8, 14, and 17 limitations are substantially the same as claim 2 above.

8. Claims 5, 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Shurts as applied to claims 1-4 and 6 above, and further in view of Timmer (U.S. Patent Application Publication No. 2002/0107895, filed Aug. 3, 2001).

8.1. As per claims 5 and 11, Shurts is directed to the information communication device according to claim 1, However, Shurts does not specify a virtual person growing means which grows a virtual person corresponding to the user based on the user's history information accumulated in said metadata storage unit, as Shurts is directed to a secured database management system, which is typically one of the major building blocks of information systems.

Timmer is directed to an interactive personalized book, which provides users with the ability to record and guide their own physical or emotional transformations over time, or collect and archive content that reflects a specific period of time of their lives. An on-line personal history diary, and evolution of personality and life style is possible parag.

9). Also as shown in parag 29-30, Timmer's system supports, for example, a

"MYLIFEBOOK" which reflects a personalization process corresponding to a person.

As mention in parag 29, the personalization tool is interactive and matures as it collects more history data about the person.

Timmer uses databases in the system development as mentioned in paragraphs 19 and 25, therefore its system incorporates the art that is analogous to Shurts' art.

Furthermore, Timmer stores personal data, which requires privacy protection. As mentioned in paragraph 2, Timmer uses a secured server and makes its data available over the Internet and via wireless systems. Therefore the skilled artisan that makes Timmer's system would be motivated to use Shurts' secured database system.

Therefore, it would have been obvious to a person skilled in the art to use Shurts' secured database management system in development of Timmer's system.

9. Claims 7-20 are substantially the same as claims 1-6 above, Note that Timmer supports exchanging emails, and Shurts creates a bidirectional communication (col. 14 line 16-30), and therefore both are capable of receiving and transmitting data.

Conclusion

11. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP

Art Unit: 2132

§ 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

12. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Farid Homayounmehr whose telephone number is (571) 272-3739. The examiner can be normally reached on 9 hrs Mon-Fri, off Monday biweekly.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gilberto Barron can be reached on (571) 272-3799. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
